Duet — Test Report

115 / 115 checks passed

11 unit · 73 end-to-end · 31 browser · 4 bugs found and fixed

Project: Duet, a voice-first baby log shared by everyone caring for a newborn
Test date: October 1, 2026 (final run 6:17–6:18 PM)
Result: 115 of 115 checks passed. Testing found 4 real bugs; all are fixed and covered by tests.

1. Summary

Test suite	Command	What it checks	Passed
Unit tests	`npm test`	How Duet understands typed or spoken sentences	11 / 11
End-to-end tests	`npm run test:e2e`	Every server feature with two caregivers and an outsider, live sync, the installable-app files, and the Android project setup	73 / 73
Browser tests	`npm run test:ui`	The real app in Microsoft Edge, with one caregiver on a phone-sized screen and one on a desktop screen at the same time	31 / 31
Total			**115 / 115**

Raw output from the final run is saved next to this report: `unit-test-output.txt`, `e2e-test-output.txt`, `ui-test-output.txt`.

2. Test environment

Item	Value
Computer	Windows 11
Runtime	Node.js 24.16
Server	Duet production build on `http://127.0.0.1:5000`

Item	Value
Database	SQLite (fresh test accounts are created for every run)
Browser	Microsoft Edge (automated, headless)
Screen sizes	Phone 390×844, tablet 768×1024, desktop 1440×900
Speech parsing	Built-in local parser (no paid AI key needed)

3. How the testing was done

Testing happens in three layers, from smallest to largest:

1. **Unit tests** check the sentence parser alone. This is the part that turns "Just gave her a 3 ounce bottle" into a logged feed of 90 ml.
2. **End-to-end tests** act like two real caregivers, Alex and Sam, plus an outsider who should be locked out. They go through the whole server: sign up, create and join a household, log entries, edit, delete, live sync, settings and export. The same suite also checks the installable-app files and the Android project.
3. **Browser tests** open the real app in Edge and click through it like a person would. Alex uses a phone-sized window and Sam a desktop window, at the same time, so you can watch one person's entry appear live on the other's screen.

Real speech can't be automated. For the voice test, a stand-in speech recognizer "hears" a fixed sentence. That checks everything after the speech step: the mic button, the transcript, logging, and live sync.

4. Unit tests: 11 / 11 passed

#	Test	Result
1	Logs a bottle feed and converts ounces to ml	**Pass**
2	Starts a nap	**Pass**
3	Ends an open nap and works out how long it lasted	**Pass**
4	Logs a wet diaper	**Pass**
5	Answers "When did she last eat?" from today's log	**Pass**
6	Refuses medical advice (e.g. "should I give Tylenol?")	**Pass**
7	Doesn't log gibberish	**Pass**

#	Test	Result
8	Ignores filler words in messy voice transcripts ("um, like…")	**Pass**
9	Logs a feed from "she had 4 ounces" without the word "bottle" *(added after bug #2)*	**Pass**
10	Logs a feed from "she drank 90 milliliters" *(added after bug #2)*	**Pass**
11	Says "1 minute", not "1 minutes"	**Pass**

5. End-to-end tests: 73 / 73 passed

Server (1)

Test	Result
Health check responds and confirms the app is free	**Pass**

Accounts (10)

Test	Result
Signup rejects missing fields	**Pass**
Signup rejects a password shorter than 8 characters	**Pass**
Caregiver A can sign up	**Pass**
The same email can't sign up twice	**Pass**
Login works regardless of email capitalization	**Pass**
Wrong password is rejected	**Pass**
Account info requires being signed in	**Pass**
A fake login token is rejected	**Pass**
Account info returns the right person	**Pass**
Caregiver B and an outsider can sign up	**Pass**

Household and invites (9)

Test	Result
Creating a household requires the baby's name and birth date	**Pass**

Test	Result
Caregiver A creates a household and gets an invite code	**Pass**
Household data requires choosing a household	**Pass**
An outsider can't read the household	**Pass**
An outsider can't open the live-update connection	**Pass**
A wrong invite code is rejected	**Pass**
A sees a live update the moment B joins with the invite code	**Pass**
Both caregivers appear in the household	**Pass**
B's app loads the household correctly	**Pass**

Logging: voice transcripts and typed text (13)

Test	Result
B's live-update connection opens	**Pass**
A logs a bottle from a clean voice transcript	**Pass**
B receives A's entry live, without refreshing	**Pass**
A messy voice transcript with filler words still logs *(failed before bug #2 fix)*	**Pass**
Typed text logs a wet diaper	**Pass**
Starting a nap shows the nap timer for both caregivers	**Pass**
The wake button ends the nap	**Pass**
Pressing wake with no nap running gives a friendly message	**Pass**
"When did she last eat?" answers without logging anything	**Pass**
Medical question is refused and nothing is logged	**Pass**
Gibberish isn't logged	**Pass**
An empty transcript gives a friendly message	**Pass**
Daily counts are correct (2 feeds, 1 nap, 1 diaper)	**Pass**

Edit and delete (6)

Test	Result
A edits the bottle's amount and adds a note	**Pass**
B sees the edit live	**Pass**
Editing an entry that doesn't exist returns "not found"	**Pass**
An outsider can't edit the entry	**Pass**
B deletes the entry; it disappears for A and the counts go down	**Pass**
Deleting the same entry twice returns "not found"	**Pass**

Summary, settings and export (12)

Test	Result
The daily summary lists the right counts	**Pass**
The owner renames the baby and B sees it live	**Pass**
A non-owner can't change the invite code	**Pass**
The owner changes the invite code and the old one stops working	**Pass**
A caregiver can change their display name	**Pass**
The export includes the household, caregivers, entries and messages	**Pass**
A non-owner can't delete the household	**Pass**
The owner can't remove themselves *(added after bug #1)*	**Pass**
The owner removes B, who has logged entries, and B loses access *(failed before bug #1 fix)*	**Pass**
B's past entries stay in the log after removal *(added after bug #1)*	**Pass**
B can rejoin with the current invite code *(added after bug #1)*	**Pass**
The owner deletes the household (cleanup)	**Pass**

Android app can reach the server (3)

Test	Result
Server accepts requests from the Android app's address `https://localhost`	**Pass**
Server accepts requests from `capacitor://localhost`	**Pass**

Test	Result
Server accepts requests from `http://localhost`	**Pass**

Installable web app (11)

Test	Result
The page has the manifest link and the iPhone install tags	**Pass**
The manifest has every required field, including "standalone" display	**Pass**
The manifest includes 192px, 512px and maskable icons	**Pass**
Every icon loads and is exactly the size it claims to be	**Pass**
The iPhone home-screen icon is 180×180	**Pass**
The browser-tab icon loads	**Pass**
The service worker stores the app shell for offline use	**Pass**
Every file the service worker stores actually exists	**Pass**
Live data (the API) is never served from the offline cache	**Pass**
Unknown links open the app instead of a blank 404 page	**Pass**
The page background is warm linen before the app loads (no white flash)	**Pass**

Android project setup (8)

Test	Result
App ID `com.duet.household`, name "Duet", built from the same web code	**Pass**
The Android app ID and label are correct	**Pass**
Internet and microphone permissions are set; plain HTTP to the computer is allowed	**Pass**
The native speech-recognition plugin is registered	**Pass**
Launcher icons and splash screens exist for every screen density	**Pass**
The launcher icon is the Duet icon, not the Capacitor default	**Pass**
The Android copy of the web app matches the latest build	**Pass**
The Android app points at `10.0.2.2:5000` (the emulator's address for your computer)	**Pass**

6. Browser tests: 31 / 31 passed

Landing page and layout (6)

Test	Result
Landing page fits a phone screen without sideways scrolling	**Pass**
Every main button has a visible white label on phone *(added after bug #4)*	**Pass**
Landing page fits a desktop screen without sideways scrolling	**Pass**
Every main button has a visible white label on desktop *(added after bug #4)*	**Pass**
Landing page fits a tablet screen	**Pass**
Edge reports the site as installable with no manifest errors	**Pass**

Signup and household, Alex on a phone (3)

Test	Result
Alex signs up through the form	**Pass**
Alex creates a household and gets an invite code	**Pass**
Alex logs the first entry by typing during setup	**Pass**

Sam joins on a desktop (2)

Test	Result
Sam signs up and joins with the invite code	**Pass**
Sam sees Alex's first entry on the Today screen	**Pass**

Voice and text logging with live sync (7)

Test	Result
Alex logs by voice: mic button, then transcript, then logged	**Pass**
Sam sees the voice entry live, without refreshing	**Pass**
Alex logs by typing and the nap timer appears	**Pass**
Sam sees the nap live	**Pass**
"She woke up" button ends the nap	**Pass**

Test	Result
The "Last feed?" quick button answers	**Pass**
A medical question gets a polite refusal	**Pass**

Edit and delete with live sync (3)

Test	Result
Sam edits the bottle's amount and adds a note	**Pass**
Alex sees the edit live	**Pass**
Sam deletes the diaper entry and it disappears for Alex	**Pass**

Summary and settings screens (4)

Test	Result
Summary works and fits on phone	**Pass**
Settings screen fits on phone	**Pass**
Summary works and fits on desktop	**Pass**
Settings screen fits on desktop	**Pass**

Offline: how the installed app behaves (4)

Test	Result
The service worker takes control of the page	**Pass**
An entry typed while offline is saved to send later	**Pass**
Reopening the app offline shows a clear message (not a blank screen) and stays signed in *(failed before bug #3 fix)*	**Pass**
Back online, the app reloads itself and the saved entry reaches Sam	**Pass**

Session (2)

Test	Result
Staying signed in survives a normal page reload	**Pass**
No JavaScript errors during the whole run	**Pass**

7. Bugs found by testing (all fixed)

#	Bug	How it was found	Fix
1	**Removing a caregiver crashed the server.** It failed for anyone who had ever logged an entry, because the database wouldn't delete a caregiver who still had entries.	End-to-end test: "Owner removes B" got a server error	Removal now takes away the caregiver's access but keeps their past entries. They can rejoin with an invite code, and the owner can't remove themselves.
2	**"She just had 4 ounces" wasn't logged.** The parser recognized "ounce" but not "ounces", and missed "drank". This matters most for natural speech.	End-to-end test: messy voice transcript came back as "unclear"	Added "ounces", "drank" and "milliliters" to the feed words, with 2 new unit tests.
3	**Opening the installed app offline signed the user out.** The failed account check erased the saved login.	Code review while writing the offline browser test	The app now keeps you signed in offline, shows "You're offline…", and reloads by itself when the connection returns.
4	**The header button on the landing page had no visible label.** It showed as a blank black bar because a header style made its text dark on a dark background.	Looking over the browser-test screenshots	Fixed the text color and shortened the label to "Get started". A new check makes sure every main button has a visible white label.

8. What was not tested, and why

Not tested	Why	How to check it yourself
Running inside the Android emulator	Android Studio isn't installed on the test computer	Install Android Studio, run `npm start`, `npm run cap:sync`, `npm run cap:open`, then press Run. Speak into the mic once.
Real spoken voice	Automated tests can't use a microphone; a stand-in recognizer was used	Open the site in Chrome, tap the mic and say "Just gave her a 3 ounce bottle."
iPhone Safari "Add to Home Screen"	No iPhone or Mac was available	On an iPhone: open the site in Safari, tap Share, then "Add to Home Screen".

9. How to run the tests again

With the server running (`npm start`) in one terminal, run these in another:

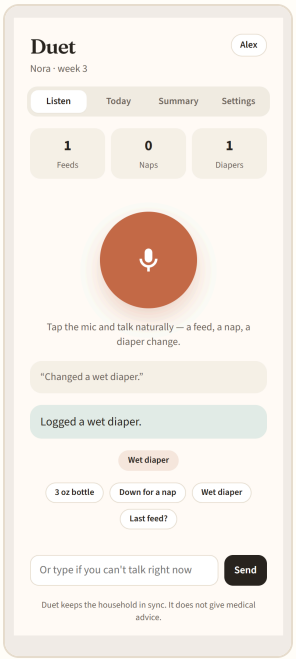

```
npm test          # 11 unit tests
npm run test:e2e  # 73 end-to-end tests
npm run test:ui   # 31 browser tests (screenshots saved to test-results/)
```

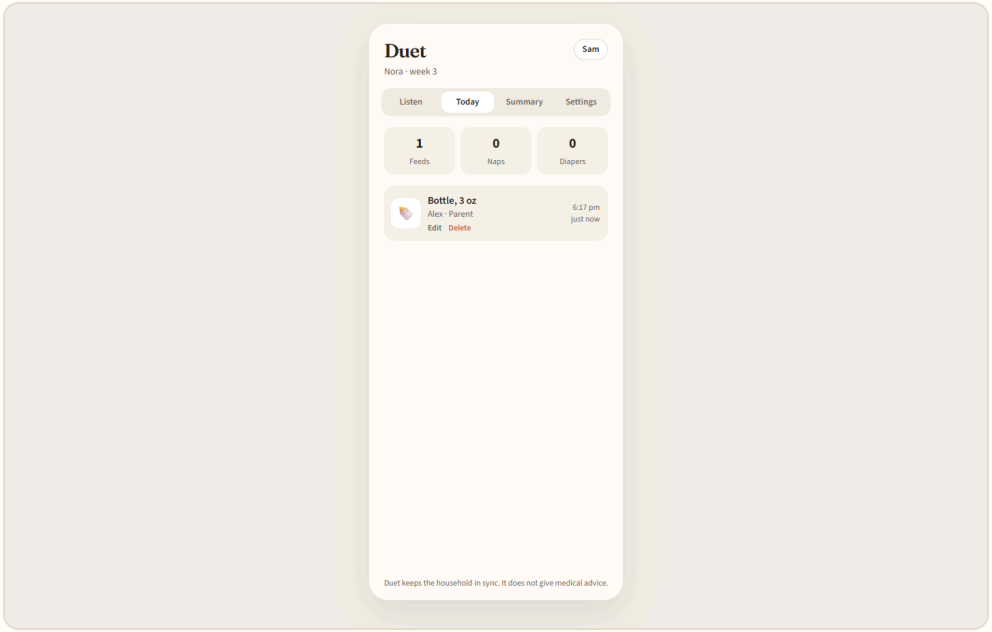

Each one should end with `0 failed`.

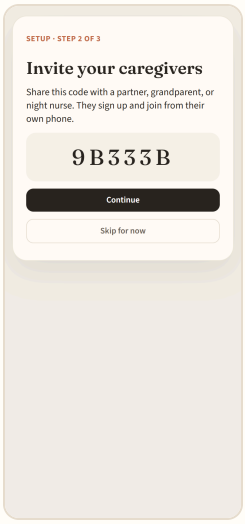

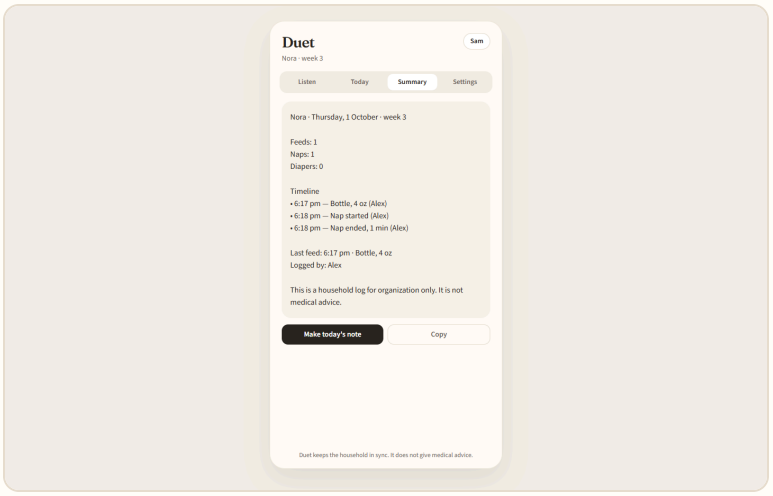

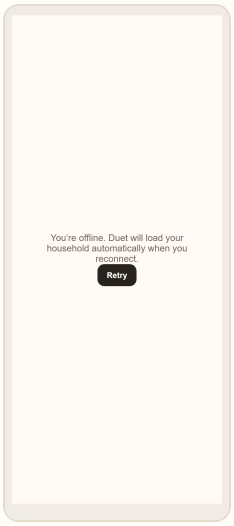

---

10. Screenshots from the browser tests

Phone: voice entry logged	Desktop: live Today timeline

Phone: invite code	Desktop: daily summary	Phone: offline screen
		

All screenshots are in `docs/screenshots/`.
